

Social Media Performance Analysis

Insights & Recommendations

Prepared for:	Marketing Leadership
Prepared by:	Senior Data Analyst
Date:	March 2026

Executive Summary

This past year, we published 450 posts across Instagram, TikTok, Twitter/X, and Facebook. Those posts generated **13.2M impressions**, reached **9.5M unique users**, and drove **870K total engagements** — all while adding **10,000 new followers** to our audience at a total spend of **\$117,573**.

At a headline level, those are solid numbers. But once you dig into the data, a sharper story emerges: a small number of platforms, content types, and campaign strategies are responsible for most of that performance. The rest is background noise.

Three patterns are consistent throughout the entire dataset:

- TikTok leads on engagement rate and isn't particularly close
- Video content outperforms every other format
- Posts published in the afternoon outperform every other time slot

None of these are marginal differences — they're significant gaps that should directly shape how we allocate time and budget going forward.

What the Data Actually Shows

1. TikTok Leads — and It's Not Particularly Close

TikTok's engagement rate across 124 posts is **8.97%**. Instagram comes in at **6.26%** across 129 posts. Twitter/X at **3.86%** across 118 posts. Facebook at **3.46%** across 79 posts.

TikTok is generating more than 2.5× the engagement of Facebook and Twitter/X, and it's doing it at meaningful scale — 124 posts is a real sample size, not a handful of outliers. Instagram is a solid second and sits above the 6.61% global average. Facebook and Twitter/X are both below it.

Worth noting: our overall account engagement rate is **6.61%**, which matches the global benchmark exactly. There's nothing wrong with that — but it also means we're not beating it yet. Leaning harder into TikTok and Instagram is the clearest path to changing that.

What this means in practice: TikTok should be first priority for content investment and budget, Instagram second. Facebook and Twitter/X should be maintained but not resourced heavily until we see evidence that the returns justify it.

2. Video Is the Format That Moves People

Video posts averaged a **9.35%** engagement rate across all platforms — the highest of any format. Carousel came in at **6.10%**. Images at **4.88%**. Text at **2.85%**.

The video advantage holds across platforms. On TikTok it hits 14.03%. On Instagram, 5.75%. Even on Twitter/X, video at 3.46% still outperforms text at 4.15% — though the gap narrows there. Every one of our top viral posts is either a TikTok video or an Instagram carousel. The format and platform combination is doing most of the work.

What this means in practice: The content calendar should shift to video-first. Carousels work well for product storytelling. Images and text have a place but shouldn't be anchoring campaigns.

3. Campaigns Are Not Created Equal

Summer Vibes produced 269,120 total engagements at an 8.08% engagement rate and \$0.10 CPE — our most efficient campaign of the year. **Spring Launch** generated the most follower growth at 2,833 new followers. At the other end, **Back to School** produced 50,982 engagements at a 5.18% rate, well below average.

Both high performers shared the same profile: strong seasonal relevance, video-forward content, and clear visual storytelling.

One honest note worth raising: impressions and reach are both down meaningfully compared to July peaks — **37.2%** and **41.3%** respectively. That's not alarming on its own; seasonal patterns explain some of it. But it's worth watching heading into Q4 planning.

Also worth flagging on the cost side: total spend across campaigns was **\$117,573** at a **\$0.13 CPE**. Summer Vibes was the most efficient at roughly \$0.10 CPE — meaning it delivered more engagement per dollar than any other campaign.

What this means in practice: Future campaigns should be built around the Summer Vibes model — seasonal hook, video content, single clear visual identity. We have a proven template. Use it.

4. When You Post Matters More Than We've Been Treating It

Afternoon posts average a **7.47%** engagement rate. Evening comes in at **7.15%**. Morning drops to **5.69%** and midday to **5.53%**. That's a nearly 2-percentage-point gap between our best and worst posting windows — on the same content.

What this means in practice: Default to afternoon publishing unless there's a specific reason not to. This is a low-effort, no-cost optimisation.

5. Boosting Works — But Only If You're Selective

Boosted posts averaged **38,217 reach** and **3,542 engagements** per post. Organic posts averaged **13,930 reach** and **1,247 engagements**. That's roughly a 2.7× lift in reach and engagement from boosting.

The cost difference is small — \$0.12 CPE organic versus \$0.14 boosted. The reach multiplier is significant. But boosting a weak post just amplifies mediocrity. Three of our viral posts hit over 10,000 engagements with no boost at all.

What this means in practice: Publish first, boost selectively. Give posts 24–48 hours organically, identify what's already gaining traction, then put budget behind those. Stop boosting posts that aren't moving.

6. One Number to Watch

Our follower conversion rate sits at **0.11%**. With 870K engagements across the year, we converted roughly 10,031 followers. The engagement quality score is **1,547,421** — a strong signal that interactions are substantive, not just passive impressions. That said, the conversion ratio still suggests many people are engaging with individual posts without committing to following the account long-term. Stronger profile-level CTAs and content that explicitly rewards following — exclusive previews, series content, behind-the-scenes — would likely move that number.

Recommendations

These follow directly from the patterns in the data.

1. Invest more in TikTok.

Scale content volume and production quality on the platform that's already outperforming everything else.

2. Make video the default.

Reorient the content calendar around video-first storytelling, with carousels and images in a supporting role.

3. Replicate the Summer Vibes blueprint.

Seasonal theme, strong visuals, video format. That combination works. Build Q2 campaigns around it.

4. Lock in afternoon publishing.

Standardise the posting schedule. It costs nothing and the engagement data is clear.

5. Boost based on performance, not plan.

Shift from pre-scheduled boosting to a promote-what's-working model. It's more efficient and the data supports it.

6. Set a follower conversion target.

Aim to lift the 0.06% rate meaningfully over the next two quarters. Track it as a KPI alongside engagement rate.

Final Thought

The brand is performing in line with industry benchmarks — our **6.61%** average engagement rate matches the global average, total reach is strong at 9.5M, and the \$0.13 CPE represents reasonable efficiency for the spend. But the data consistently points in one direction: a small number of decisions — platform, format, timing — account for most of the results.

The opportunity isn't to do more. It's to do more of what already works.
